

**WEB ACADEMY**

# Front End за Начинаещи JavaScript

An illustration of a wooden desk with various art supplies. On the left, there is a paintbrush with a yellow tip and a brown handle, and a palette with yellow, green, and blue paint. On the right, there is a paintbrush with a yellow tip and a brown handle, and a palette with yellow, green, and blue paint. In the center, the word 'JavaScript' is written in a large, bold, green font. Below it, there is a code snippet in a smaller, green font. On the bottom left, there is a small, green, circular graphic element. On the bottom right, there is a yellow square with a black border, containing a large, stylized 'JS' logo. The background is a light brown color with a subtle wood grain pattern.

## JavaScript

```
<script>  
  document.write('Awesome!');  
</script>
```

# Методи на Array обекта

Method	Description
<a href="#"><u>concat()</u></a>	Joins two or more arrays, and returns a copy of the joined arrays
<a href="#"><u>copyWithin()</u></a>	Copies array elements within the array, to and from specified positions
<a href="#"><u>every()</u></a>	Checks if every element in an array pass a test
<a href="#"><u>fill()</u></a>	Fill the elements in an array with a static value
<a href="#"><u>filter()</u></a>	Creates a new array with every element in an array that pass a test
<a href="#"><u>find()</u></a>	Returns the value of the first element in an array that pass a test
<a href="#"><u>findIndex()</u></a>	Returns the index of the first element in an array that pass a test
<a href="#"><u>forEach()</u></a>	Calls a function for each array element
<a href="#"><u>indexOf()</u></a>	Search the array for an element and returns its position
<a href="#"><u>isArray()</u></a>	Checks whether an object is an array
<a href="#"><u>join()</u></a>	Joins all elements of an array into a string
<a href="#"><u>lastIndexOf()</u></a>	Search the array for an element, starting at the end, and returns its position
<a href="#"><u>map()</u></a>	Creates a new array with the result of calling a function for each array element

# Методи на Array обекта

Method	Description
<u>pop()</u>	Removes the last element of an array, and returns that element
<u>push()</u>	Adds new elements to the end of an array, and returns the new length
<u>reduce()</u>	Reduce the values of an array to a single value (going left-to-right)
<u>reduceRight()</u>	Reduce the values of an array to a single value (going right-to-left)
<u>reverse()</u>	Reverses the order of the elements in an array
<u>shift()</u>	Removes the first element of an array, and returns that element
<u>slice()</u>	Selects a part of an array, and returns the new array
<u>some()</u>	Checks if any of the elements in an array pass a test
<u>sort()</u>	Sorts the elements of an array
<u>splice()</u>	Adds/Removes elements from an array
<u>toString()</u>	Converts an array to a string, and returns the result
<u>unshift()</u>	Adds new elements to the beginning of an array, and returns the new length
<u>valueOf()</u>	Returns the primitive value of an array

# Методи на Array обекта

```
var fruits = ["Banana", "Orange", "Lemon", "Apple", "Mango"];

var citrus = fruits.slice(1,3); // Връща елементите с индекс в интервал [1,3)
var citrus = fruits.slice(2);   // Връща елементите с индекс >= 2
fruits.splice(0, 2);           // Премахва първите 2 елемента на масива
fruits.splice(2, 0, "Kiwi");    // Добавя елемента "Kiwi" на втора позиция
fruits[fruits.length] = "owl"; // Добавя елемента "owl" на последна позиция
fruits.unshift("Kiwi");        // Добавя елемента "Kiwi" като първи елемент
fruits.shift();                // Премахва и връща първия елемент на масива
fruits.push("Kiwi");           // Добавя елемента "Kiwi" на последна позиция
var x = fruits.pop();          // Премахва и връща последния елемент
fruits.join(" * ");            // Слепва елементите на масива с указания низ

var child1 = ["Чанита", "Попова"];
var child2 = ["Кремена", "Желева"];
var WA_Children = fruits.concat(child1, child2);
```

# Методи на String обекта

Method	Description
<a href="#"><u>charAt()</u></a>	Returns the character at the specified index (position)
<a href="#"><u>charCodeAt()</u></a>	Returns the Unicode of the character at the specified index
<a href="#"><u>concat()</u></a>	Joins two or more strings, and returns a new joined strings
<a href="#"><u>endsWith()</u></a>	Checks whether a string ends with specified string/characters
<a href="#"><u>fromCharCode()</u></a>	Converts Unicode values to characters
<a href="#"><u>includes()</u></a>	Checks whether a string contains the specified string/characters
<a href="#"><u>indexOf()</u></a>	Returns the position of the first found occurrence of a specified value in a string
<a href="#"><u>lastIndexOf()</u></a>	Returns the position of the last found occurrence of a specified value in a string
<a href="#"><u>localeCompare()</u></a>	Compares two strings in the current locale
<a href="#"><u>match()</u></a>	Searches a string for a match against a regular expression, and returns the matches
<a href="#"><u>repeat()</u></a>	Returns a new string with a specified number of copies of an existing string
<a href="#"><u>replace()</u></a>	Searches a string for a specified value, or a regular expression, and returns a new string where the specified values are replaced
<a href="#"><u>search()</u></a>	Searches a string for a specified value, or regular expression, and returns the position of the match

# Методи на String обекта

Method	Description
<a href="#"><u>search()</u></a>	Searches a string for a specified value, or regular expression, and returns the position of the match
<a href="#"><u>slice()</u></a>	Extracts a part of a string and returns a new string
<a href="#"><u>split()</u></a>	Splits a string into an array of substrings
<a href="#"><u>startsWith()</u></a>	Checks whether a string begins with specified characters
<a href="#"><u>substr()</u></a>	Extracts the characters from a string, beginning at a specified start position, and through the specified number of character
<a href="#"><u>substring()</u></a>	Extracts the characters from a string, between two specified indices
<a href="#"><u>toLocaleLowerCase()</u></a>	Converts a string to lowercase letters, according to the host's locale
<a href="#"><u>toLocaleUpperCase()</u></a>	Converts a string to uppercase letters, according to the host's locale
<a href="#"><u>toLowerCase()</u></a>	Converts a string to lowercase letters
<a href="#"><u>toString()</u></a>	Returns the value of a String object
<a href="#"><u>toUpperCase()</u></a>	Converts a string to uppercase letters
<a href="#"><u>trim()</u></a>	Removes whitespace from both ends of a string
<a href="#"><u>valueOf()</u></a>	Returns the primitive value of a String object

# СЪБИТИЯ

- Събитията (events) възникват, когато нещо се случи, а JavaScript от своя страна реагира на тези събития
- Свързват се с конкретен елемент от страницата

```
<button onclick="this.innerHTML=Date()">The time is?</button>
```

- Най-често използвани събития:

Event	Description
onchange	An HTML element has been changed
onclick	The user clicks an HTML element
onmouseover	The user moves the mouse over an HTML element
onmouseout	The user moves the mouse away from an HTML element
onkeydown	The user pushes a keyboard key
onload	The browser has finished loading the page

Какво ни е нужно?

- Намиране на HTML елементи
- Промяна на HTML елементи
- Добавяне и премахване на елементи

Вижте още:

- JavaScript HTML DOM Document
- JavaScript HTML DOM Elements
- CSS-JS References

## Намиране на HTML елементи

- по id атрибут
- по име на таг
- по име на клас
- по CSS селектор
- по колекция от обекти

```
var myElement = document.getElementById("main");  
var x = document.getElementsByTagName("p");  
var y = document.getElementsByClassName("intro");  
var z = document.querySelectorAll("p.intro");
```

```
var x = document.forms["frm1"];  
var text = "";  
var i;  
for (i = 0; i < x.length; i++) {  
    text += x.elements[i].value + "<br>";  
}  
document.getElementById("demo").innerHTML = text;
```

First name:

Last name:

Donald  
Duck  
Submit

Промяна на HTML елементи е възможна чрез:

- HTML съдържание
- име на атрибут
- метод `setAttribute`
- свойство `style`

```
element.innerHTML = new html content;
```

```
element.attribute = new value;
```

```
element.setAttribute(attribute, value);
```

```
element.style.property = new style; // Псевдо код
```

```
<div id="main"></div>
```

```
<script>
```

```
var element = document.getElementById('main');
```

```
element.innerHTML = "new html content";
```

```
element.title = "Change Title Attribute";
```

```
element.setAttribute("title", "New Title Again");
```

```
element.style.border = "1px solid blue";
```

```
</script>
```

*// Примерен код*

## Методи за добавяне и премахване на елементи:

- `document.createElement(element)` - създава елемент
- `document.removeChild(element)` - премахва елемент
- `document.appendChild(element)` - добавя елемент
- `document.replaceChild(element)` - замества елемент

```
<input type="button" onclick="addNew();" value="+"><ol id="my_list"></ol>
<script>
var i = 1;
function addNew(){
  var element = document.createElement('li');
  element.id= "item_"+i;
  element.innerHTML = 'New Item '+i;
  document.getElementById('my_list').appendChild(element); i++;
}</script> <!-- Динамично добавяне на нов елемент към списък -->
```

# Поздравления!

13

Този модул приключи!

Желаем Ви късмет с финалния изпит!

Вече знаете, какво е HTML & CSS & JS!

*HTML = How To Meet Ladies*

*CSS = Countless Sex Styles*

*JS = Just Sex*
